

Candles & Wicks

What a Candlestick Represents

- ▲ A candlestick shows how price moved during a **specific timeframe** (1 min, 15 min, 1H, 4H etc.).
- ▲ It helps traders “see” **market behavior** quickly without reading numbers.
- ▲ It is made of three main parts: **the body** (open → close) and **the two wicks** (high → low).
- ▲ Each candle **represents a battle for controlling the market** between buyers and sellers during that period.
- ▲ Each candle tells a **mini-story about pressure, momentum, and rejection**.
- ▲ Most candles (80–85%) naturally form **two wicks and a clear body**.

Candles “speak a certain language”, they help us communicate with the market.

“Healthy” vs. “Non-Healthy” Candles

Healthy Candle (clear story):

- ▲ Has two wicks and a solid, visible body.
- ▲ Shows controlled price action → easier to read.
- ▲ Indicates balanced participation between buyers and sellers before direction is chosen.

Candles provide “clues” with their bodies, wicks and closures on each timeframe.

Non-Healthy Candle (unclear story):

- ▲ Missing a wick (top or bottom).
- ▲ Missing both wicks.
- ▲ Body extremely small or nonexistent.
- ▲ Usually forms during news events, low volume, or erratic conditions → hard to interpret.

Candle Structure (Body + Wicks)

The 3 parts of a candle:

- ▲ **Body** = where price opened and closed (shows strength or weakness).
- ▲ **Upper wick** = how high price went before rejecting.
- ▲ **Lower wick** = how low price went before rejecting.
- ▲ Most candles (80–85%) naturally **form both wicks and a body** → this provides the clear story we need.
- ▲ Think of candle bodies as **your business partners**—let them form fully, and only trust strong, healthy candles as confirmation before taking any trade.

In situations like this, I want to let more candles print. Gather more information from the market. Be patient.

I will have an opportunity later on, with a candle that is "healthy", with strong body and both wicks, to take my buys from.

Example – Utilizing “Healthy” candles

In this example, we notice a new support being formed with a strong healthy bullish candle, which acts as my “Business Partner – The Confirmation candle” from which I can take a clean Buy trade.

What Wicks Actually Mean

Wicks = rejection and / or remaining “range.”

- ▲ A wick shows where price attempted to move but failed to stay.
- ▲ Wicks leave behind a “range” that future candles may fill.
- ▲ Long wicks often signal strong rejection or liquidity grabs (advanced concept explained later).
- ▲ Wicks help us anticipate direction, momentum shifts, and potential entries.
- ▲ If candles do have wicks, I am in a “good market trend”. If there are no wicks, I better wait for price action to play out further and gather more information.

That upper wick on (A). represents a range that will get filled, probably when the next candle opens.

The next candle has to first create a bottom wick (B), and then move bullish to create its own top wick and also fill the previous candle's wick (range).

Specifically at times of High Volume (e.g. Session Opens) these wicks have very high probability of getting filled

Example – *Bearish “Wickfill”*

That Lower wick on (C). represents a range that will get filled, probably when the next candle opens.

The next candle has to first create a top wick (D), and then move bearish to create its own bottom wick and also fill the previous candles wick (range).

No Top / Bottom Wick – What does this mean?

- ▲ This means that there is **no range above** (Bullish example) or **below** (Bearish example) to **get filled later**.
- ▲ It doesn't mean that price will not move bullish (A), but **there is lower probability** (50%-50%) to speculate where the market is going to go.
- ▲ Respectively for the bearish example (B), it doesn't mean that price will not move bearish, but there is **lower probability to speculate** where the market is going to move to.
- ▲ Most of the times that I see **NO top/bottom wicks**, price **needs to pull back a bit first**, to then go and **create that missing top/bot wick**.

Wicks & Trend Following

- ▲ Wicks show the **highs and lows** of each candle, giving **clues about market strength and direction**.
- ▲ Long wicks indicate **rejection or exhaustion** — buyers/sellers were tested but price moved back.
- ▲ Follow the trend by observing **how wicks confirm direction before taking a trade** — they act as early signals of momentum.

Trends can be identified by wick behavior:

- ▲ **Higher highs and higher lows** in **bullish** trends
- ▲ **Lower highs and lower lows** in **bearish** trends.

Example – *Bullish Trend*

*I want to see the “trend”
continuing up on a
bullish market.*

Example – *Bearish Trend*

*I want to see the “trend”
continuing down on a
bearish market.*

“Exhaustion Wicks” vs “Wick Fills”

Exhaustion wicks:

- ▲ Occur when price tries to push higher or lower but gets strongly rejected.
- ▲ Show that **momentum is weakening** — buyers or sellers are losing control.
- ▲ Often signal a possible reversal or pause in the current trend.
- ▲ **Example:** a long upper wick in a bullish move may indicate sellers are stepping in.

Wick fills:

- ▲ Happen when **price returns to revisit the wick of a previous candle**.
- ▲ Indicates an area of market **inefficiency or a liquidity grab** — the market “fills” the untested range.
- ▲ Shows that price **seeks to balance** before continuing the trend.
- ▲ Useful for **identifying support/resistance** zones and potential **entry levels**.

“Exhaustion Wicks” & “Wick Fills” - *Example*

- ▲ When I see a **strong candle body** with a **proper wick to fill (A)**, from a previous candle on the left side, then I will utilize the next candle to enter on a buy and fill that previous candle's wick.
- ▲ If the candle has an “Ok”, or even “Strong” body, **but the wick is huge**, need to care as this may be classified as “**Exhaustion wick**” (B), even if the candle closes bullish on that bullish scenario
- ▲ Exhaustion Wicks are very **powerful clues** for price direction if formed after price taps a HTF Resistance or Support level.

Most times will see the above case (B) on a strong level of Support / Resistance, when price hits that on High Timeframes it will "tap" it and then reject and form these kinds of candles with "Exhaustion Wicks".

The best I can do with these candles is wait for more candles to print and for the market to provide me with more information.

The Importance of Candle Closures

- ▲ **Patience and discipline** are critical — never rush into a trade before the candle closes.
- ▲ Wait for **candle closure** on your timeframe (e.g., 15m, 30m, 1H, 4H) before making decisions.
- ▲ **Observe where the candle closes** — above or below a range, bullish, bearish, or Doji — it tells the market's intention.
- ▲ Consider **timing relative to higher and lower timeframes** — e.g., is the 4H candle near its close? How is the 1H candle reacting?
- ▲ **Candle closure confirms setups** — only act when price action aligns with your plan and timeframe context.

Candle Closures – *Example (1/2)*

- ▲ During a Range / Consolidation, candles try to make a **decision**. I want to see a clear candle body, to break out and close outside (above or below) the range. That will be my **Confirmation candle**.
- ▲ Specially in times of High Volume (Session Openings) I want to **take advantage of that volume**, which is key to our scalping setups.
- ▲ **Always wait for candle closures**, evaluate how “**healthy**” my **confirmation candle** is and if I see one of my playbook setups during high volume times, this is my trade.
- ▲ I always need a bottom wick formed first on my trading candle, before I enter a Buy trade.
- ▲ I always need a top wick formed first on my trading candle, before I enter a Sell trade.

If candles close with weak body (even if my setup is there) I want to wait for more candles to print or look for higher timeframe confirmations (e.g. from 15mins to 30mins).

Candle Closures – *Example (2/2)*

- ▲ Super Important to wait for proper candle closures, with candle bodies above or below the range / consolidation.
- ▲ On ranges, many times beginner traders get manipulated / they become the liquidity grabs, lose their traders and reduce their mental capital for the day due to impatience.
- ▲ In situations like this example, I want to wait for some kind of a breakout, a leader candle, strong and healthy to close above or below the range and indicate some direction. Always keep in mind HTF direction as well (D-4H).
- ▲ Need to have patience and wait for candles to tell me the “story”.
- ▲ Got to stay discipline until my A+ Setup appears and not take mental hits & losing my risk/capital for the day, with losing trades outside of my plan and due to impatience.

“Patience, pays, We get paid to wait for an A+ to appear and then we execute on it”

The Daily Candle – Why It Matters

- ▲ **The Daily timeframe sets the tone for the day:** The Daily candle gives us the big picture: overall momentum, market sentiment, and directional bias. Lower timeframes should be traded in alignment with the Daily narrative.
- ▲ **Previous Daily candle close = momentum clue:** A strong bullish or bearish close suggests continuation potential. A Doji or indecision candle suggests balance, pause, or potential reversal. This helps define expectations, not guarantees.
- ▲ Early in the day, price often creates a top or bottom wick (manipulation). The session then expands toward targets, and the Daily close confirms intent. Knowing which wick is likely to form first helps with patience and timing.
- ▲ **Daily Highs, Lows & Key Supply & Demand Levels = primary targets:** Previous Daily high/low, open, and major support/resistance act as magnets. These levels define where price wants to go or is likely to react.
- ▲ **The Daily candle guides your intraday plan:** Your goal is not to trade the entire Daily candle – but to trade a portion of its story using 4H and lower timeframes, aligned with the Daily bias.

A **Doji** is a candle where the open and close are almost the same, showing market indecision and a balance between buyers and sellers.

Understanding Technical Concepts

What Is Top-Down Analysis? – *(Why It Matters)*

- ▲ Top-down analysis means starting from higher timeframes and working your way down to **understand the market “story”** & try to “build the daily candle”.
- ▲ **It gives structure to your routine** — every trading day should begin with a clear plan and directional bias.
- ▲ Each timeframe acts like a **“chapter” in a book**, adding important clues about price behavior.
- ▲ **Higher timeframes** (Daily, 4H) set the **overall direction** and sentiment of the market.
- ▲ **Lower timeframes** (1H, 30M, 15M) are used to refine **entries** and find precise setups.
- ▲ Think of dropping timeframes as **“zooming in”** on the big daily candle to see the details inside it.

How to Perform Top-Down Analysis *(Step-By-Step)*

1

Start with the Daily timeframe (clean chart)

Identify the major Supply & Demand zones and observe where price currently sits.

Check the overall market Trend and How previous daily closed for extra clues on direction.

2

Work down through the timeframes

(D → 4H → 1H
→ 30M → 15M)

Mark the closest to price Support & Resistance levels.

Take a quick look on the left side of the chart on each timeframe, for “choppy” areas and clean ranges.

3

Now, focus on the 4H chart for more accurate data

Refine your S&D zones, “trap” the current price in a range and identify key wicks or important candle closures & levels.

Identify the 4H targets. Is the price going towards a target or has already tapped a 4H target?

4

Drop to the 1H chart and refine

Sharpen your range even more. Look for potential wick fills, or clean ranges that price may revisit.

Start observing the opening – closure timings on 4H – 1H candles to sync with the market.

5

Key On the 30M and 15M charts

Final adjustments – tighten your zones and observe the most recent candles, targets and liquidity areas.

Have a clear plan on which Playbook setups I am looking for.

6

Build your Daily Plan

Decide on your directional bias and write down exactly what you want the market to show you before taking a trade – following your rules and playbook with no deviation.

If a setup appears, plan everything about the trade, 3-5 mins before entry.

Importance of Valid Supports & Resistances

- They show **where price reacted strongly in the past.**
- These zones help traders **anticipate where buyers or sellers may step in again**, making them key decision points for entries and exits.

- They provide structure and clarity in your trading plan.
- Valid S&R levels help define direction, risk, and targets, keeping your analysis consistent and preventing emotional or impulsive trades.

“Mark the “Fresh” Support and Resistance levels. Keep an eye on the left side of the chart, for old levels – Rejections and old choppy areas. They all give an indication & clues.

Ranges will most likely occur after big impulsive moves (market needs to “breath”). Price waits for the next set of volumes and forms ranges to gather liquidity and then move.”

How to Follow Price and Understand S&R levels

- ▲ **Update your levels before each session** — mark fresh Support/Resistance and new ranges so you always trade with a clear plan.
- ▲ **Always look left** — previous highs, lows, and key levels help refine ranges, set profit targets, spot rejection zones, and avoid Fake-outs.
- ▲ **Respect the 4H bias** — understand how the current 4H candle is forming (top wick, body, bottom wick) and whether a wick or clean range is likely to be filled.
- ▲ **Use HTF wicks as LTF ranges** — a previous 4H wick to fill often becomes a clean, tradable range on the lower timeframes.
- ▲ **Expect manipulation** — price often triggers buyers/sellers first (liquidity grab) before making the real move; wait for confirmation.
- ▲ **Trade clean ranges, avoid the chop** — after big impulsive moves price consolidates (refuels), grabs liquidity, then continues during high-volume times.

“Looking left will always get me right”

The Importance of Clean Ranges

What Are Clean Ranges?

- ▲ Clean ranges are areas on the chart where price previously moved smoothly (big candle moves), with **minimal pullbacks or obstacles**.

Why They Matter:

- ▲ Clean ranges provide **high-probability trading opportunities** because price can move through them efficiently with less resistance.
- ▲ **Avoid choppy ranges** — when price is stuck inside messy back-and-forth candles, wait for a clear break and close outside before planning a trade. **Wait for our Playbook setups to appear.**
- ▲ Price moves best when there is “**space**” to **travel into**, meaning only a few previous highs/lows or consolidation zones to slow it down.
- ▲ Spotting clean vs. choppy ranges **reduces unnecessary losses and filters out low-quality setups.**
- ▲ Trading into clean ranges **improves consistency, clarity, and confidence in directional bias.**

HTF – LTF Correlation

HTF Wick Fill

Key is to identify the direction from HTF (Daily – 4H) and then trade the move on LTF (15/30mins).

Example →
What a 4H Wick Fill looks like on the 15/30mins chart as a Range Fill.

I am waiting on Support to form on LTF, in order to take a buy and fill the 4H Wick.

4H Timeframe

15/30mins Timeframe

HTF Range Fill

Now that a resistance has been formed at the 15/30mins, and my bias is bullish, as the new 4H candle opens (another scenario), I would expect a push down first, in order to create the 4H new bottom wick, and then price to move up again.

- ▲ Very important to be at times of High-Volume.
- ▲ Expecting a lower wick first and then I enter on a buy to fill 15/30mins range and 4H wick fill as well.
- ▲ Only when the market shows us these opportunities, I want to enter on a trade.
- ▲ Identify also and keep in mind the 4H candle.

HTF Range Fill - Example

These are the optimal setups, but it doesn't mean that we will always find / see these.

If we cannot identify them on a day, it is better to NOT do anything, no trade days are crucial for professional traders.

No trade is a decision as well. Protect capital, keep that in mind.

Liquidity

The “Pack-Runner” LQ Concept

- ▲ This is a type of Liquidity. It will typically happen when a “confirmation candle” closes with NO Top / Bottom wick or very small one.
- ▲ So, price will probably make (e.g. a bottom / top wick) on the next candle, grab liquidity – activate the sellers / buyers – manipulate them out of the market and then it will turn bullish/ bearish and start moving back up / down.
- ▲ I want to look for it, mainly during High-Volume Times.
- ▲ It is a nice manipulation that price does, and then it has no reason to re-break that area (high/low) of the newly big wick created.

“Pack-Runner” Examples & Commentary

Example 1: On Point A, we can see price coming all the way down to create a steep bottom wick, and also “create” a bottom wick for the candle on the left that is missing one. It was an unhealthy candle.

That impulsive move with that big wick that grabbed the liquidity from previous candle’s low is called the “**Pack-Runner**”.

It happens during **High Volume times**, price comes all the way to the opposite direction of the one I want to take a trade in, grabs liquidity – manipulates traders out, creates a steep wick and then turns all the way to the opposite direction, the correct direction to be traded.

Example 2: On Point B, we do see another example of a “Pack-Runner” move at an “Onion” setup. Easier to spot, price broke the lows of the previous candle, grabbed liquidity and then closed above the marked range.

“**Pack-Runner**” is an extra confluence / confirmation for me to get into that buy trade that makes this setup even higher-probability for success.

I could enter on a buy here, even with no “Pack-Runner” as all other confirmations are there – price closed above the range with candle body, HTF Direction is bullish and I have a clean target, High-Volume time, Healthy Bottom wick formed and entry on the break of current candles high as previous is too far.

“Pack-Runner” - Bullish Example

Price is just retesting the zone.

Sellers will get activated in the two red candles above and will be taken out with the “Pack-Runner”.

Buyers will still be in control, especially with HTF Bullish bias (4H).

Waiting on sellers to be activated / manipulated, then a proper support to form above the range and then look for buy entries.

“I want to look left to go right”

“Pack-Runner” - **Bearish** Example

Price is just retesting the zone.

Buyers will get activated I the two green candles above and will be taken out with the “Pack-Runner”.

Sellers will still be in control, especially with HTF Bearish bias (4H).

Waiting on buyers to be activated / manipulated, then a proper resistance to form below the range and then look for sell entries.

“I want to look left to go right”

Liquidity Example of 2 Traders

*Trader A: New
Trader / Gambling
Mentality, dopamine
is High. Impulsive
decisions.*

*Trader B:
Experienced /
Patient, following the
Playbook with 100%
Discipline.*

Mentality of Trader A & B

Let's dive into why Mentality & Mindset are the most important pillars of success in this system:

Trader A:

- ▲ He is trying to make a ton of money quickly, he is trying to do this fast and is rushing the process, the system. He is not trusting the process. He is NOT doing that is required to take what is desired.
- ▲ What is required is being professional, being patient, being disciplined, waiting or my Playbook Setup to come to me.
- ▲ Trader A is forcing his way into the market. There is no confirmation, there is no "If A...then X and if B...then Y". He is just interested in a random push of volume and wants to be in the market just for the dopamine effect.
- ▲ Trading is a Mind Game. You have to master yourself, your mind and your emotions first in order to achieve success.

Trader B:

- ▲ Stayed calm and composed and did what Pro-Traders are supposed to do -> Did NOTHING until the setup showed up.

Example of both Traders Mental Capacity for the day

Trader A -> Mental Capacity (10)

- Lost Mental Capacity
- No Positivity / Optimism
- Not in Flow State
- No Clear Thinking
- Anger
- Sadness
- Desperation
- Lower Confidence
- Starts Hating the Game
- Considers Changing Strategy

Trader B -> Mental Capacity (10)

- Did what is required to have what is desired
- Clarity
- Calmness
- In Flow State
- At his A-Game
- Confident
- Discipline & Consistent
- Playbook setup occurred, he followed the plan to 100%, executed on the edge and WON.

The difference between Trader A and Trader B, is NOT about what they know technically but about what they do and how they behave (Mindset/Mentality).

Develop the characteristics of Trader B is our goal – keep building good habits.

← How Mental Capacity of each Trader “shapes” thought-out the day, based on their trading decisions.

Understanding Direction

How to build a Session Bias

- ▲ **Update your levels before each session** — mark fresh Support/Resistance and new ranges so you always trade with a clear plan.
- ▲ **Always look left** — previous highs, lows, and key levels help refine ranges, set profit targets, spot rejection zones, and avoid Fake-outs.
- ▲ **Respect the 4H bias** — understand how the current 4H candle is forming (top wick, body, bottom wick) and whether a wick or clean range is likely to be filled.
- ▲ **Use HTF wicks as LTF ranges** — a previous 4H wick to fill often becomes a clean, tradable range on the lower timeframes.
- ▲ **Expect manipulation** — price often triggers buyers/sellers first (liquidity grab) before making the real move; wait for confirmation.
- ▲ **Trade clean ranges, avoid the chop** — after big impulsive moves price consolidates (refuels), grabs liquidity, then continues during high-volume times.

How to build a Session Bias

Goal #1

To build the daily candle “story” and how it will play out, session by session (keep the daily timeframe in mind).

Goal #2

To have **clear bias on each session** and on how each **4H candle plays out throughout the day**. I “track” the 4H candles within the day and its “OK” to have different biases on each session.

“Arriving at the Trading Desk” – *The Process*

Identify the 4H Target

Check whether the 4H candle is still moving toward its target or has already tapped it. This determines your directional bias.

Build the Story From the 4H Structure

Use the 4H candle's body, wicks, and movement to form your narrative for the day, then drop to lower timeframes for precise setups.

If the 4H Is Moving Toward Its Target → Look for Continuation Trades

A clean bias means you focus on trading with the 4H direction, entering on healthy pullbacks and confirmation candles.

If the 4H Has Already Tapped Its Target → Expect Pullbacks

Once the target is hit, watch for rejection signs or counter-trend opportunities (quick, controlled trades only), based on lower-TF price action.

Always Align With the Daily Candle Story

Keep the overall daily structure in mind—your lower-timeframe trades must respect the higher-timeframe narrative.

The Playbook

What is a Trading Playbook?

The Playbook is our mechanical way of taking trades. It removes emotions and reduces decision making struggles.

- ▲ The Playbook is a rule-based system for taking trades, not guessing.
- ▲ It removes emotions and reduces decision fatigue.
- ▲ It defines exactly when to trade and when not to trade.
- ▲ The goal is to catch price moving through clean ranges and wicks to fill.
- ▲ If a setup is not in the Playbook, no trade is taken.
- ▲ Consistency comes from repeating the same actions every day.

Introduction to Our Trading Setups

- ▲ A setup is a specific, repeatable market situation where we are allowed to take a trade.
- ▲ Our playbook contains 6 defined setups, but not all are traded at the same stage.
- ▲ As beginners, the focus is on simplicity, clarity, and repetition (setups A, B, C).
- ▲ We prioritize high-probability, easy-to-spot setups that align with market flow.
- ▲ Mastery comes from trading fewer setups extremely well, not many poorly.

Core Setups to Focus :

- ▲ A. Breakout
- ▲ B. Onion
- ▲ C. Celery Play

Advanced Setups:

- ▲ D. Counter-Trend Trade
- ▲ E. Inverted Celery
- ▲ F. The Fade

Entries

(Excluding Impulse ones)

Why We Use Limit Orders

Buy Stops ↑ & Sell Stops ↓

- ▲ Help us enter into trades exactly when we want / should and prevents us from getting into trades too early or too late.
- ▲ Entering with Buy Stop or Sell Stop orders provides us with more confirmed “spots” to enter a trade, as the price gives an “extra confluence” on direction – Bias extra confirmation and momentum (Break of a High or a Low to continue the ongoing trend).
- ▲ I want to leave the least amount of human error as possible.

✓ *I want to create systems for my trading. I do NOT want to be the one taking all the decisions. The fewer the better.*

✓ *This is why it is very important to have systems to spot / patterns and enter trades.*

Entries — How We Get Into Trades

“Professionals don’t trade everything they see — they trade only what they’ve mastered.”

**Break of Current Candle
Highs / Lows**

**Break of Previous Candle
Highs / Lows**

Entries are taken on
lower timeframes
for precision

HTF/LTF correlation
is mandatory —
always consider 4H
direction

If the 4H is not
aligned, no trade

Break of Current Candle Highs / Lows

I want to fill that wick on the left, take advantage of these pips. There is a significant difference.

Break of Previous Candle Highs / Lows

I want to get the best confirmed / safe entry. So, if the difference is very small, like 2-3 pips, I would prefer entering on the previous candle.

4H Timeframe

Examples on both Entries

When it comes to entries, we always enter on limit orders (Buy Stops / Sell Stops) and try to not enter manually unless it is extremely required.

The Extra Entry: “The Flip” – *Rare / Riskier*

Entry on the “Flip”

A normal candle that wants to continue bullish, will open, make a very brief push up and a tiny top wick, then will turn bearish to create the proper bottom wick – (PO3) and then it will turn bullish again with the HTF Direction and push higher creating a proper candle body and a decent top wick.

Entry on the “Flip”

A normal candle that wants to continue bearish, will open, make a very brief push down and a tiny bottom wick, then will turn bullish to create the proper top wick – (PO3) and then it will turn bearish again with the HTF Direction and push lower creating a proper candle body and a decent bottom wick.

Entries Preference (Current / Previous)

I prefer the break of current candle High / Low:

- If there is clean wick or range to fill on the left side.
- Also, if previous candle High / Low is too far to enter and I could take advantage of these points.

I prefer the break of Previous candle High / Low:

- If the previous candle wick on the left, is small and has only 2-3 pips difference from current candle wick, I want to use that previous candle high/low to enter.
- I am willing to sacrifice some points for a better, more confirmed entry.
- Breaking previous candle high/low – using current candle SL.

The only “Flip” entry scenario I prefer:

- If a candle starts moving bearish with NO Top wick, bias on the 4H is heavily Bearish and then the candle comes up again, creates a top wick and starts moving back down. – This is the only “Flip” entry scenario I like, using the current candle as a SL (High or Low) – Same on a bullish scenario.

Bullish Entries Examples

4H Timeframe

15/30mins Timeframe

Bearish Entries Examples

A. Breakout

Price is Ranging / Consolidating. I am looking for HTF to get my direction (e.g. **Bullish**).

e.g. If the 4H looks like this example, I am anticipating bullish moves, and I will be looking for buys in my session.

I am anticipating the new 4H candle to make a lower wick and then shift bullish and fill previous 4H candle's wick.

4H Timeframe

15/30mins Timeframe

Price is Ranging / Consolidating. I am looking for HTF to get my direction (e.g. **Bearish**).

e.g. If the 4H looks like this example, I am anticipating bearish moves, and I will be looking for sells in my session.

I am anticipating the new 4H candle to make a top wick and then shift bearish and fill previous 4H candle's wick.

How to Reduce Fake-Outs *(You Can't Avoid Them All)*

- ▲ **Start with the 4H Bias:** Always define your directional bias from the 4H timeframe first. HTF → LTF correlation is your main filter against fake-outs.
- ▲ **Respect the Power of the 4H Candle:** Most fake-outs happen when traders try to trade against the 4H bias. If the 4H trend is bullish, downside breaks on LTF often fail — and vice versa.
- ▲ **Wait for HTF Confirmation, Not Just LTF Breaks:** A LTF range break is not enough on its own. Many times price briefly closes outside a range, then re-enters before the 4H closes and continues in the HTF direction.
- ▲ **Fake-Outs Are Designed to Look Good:** You will never avoid all fake-outs — they exist to trap traders. The goal is not perfection, but reducing low-probability trades through structure and bias.

Think in **Scenarios**, Not Certainty:

- ▲ If HTF is bullish and LTF breaks down → be cautious.
- ▲ If HTF is bearish and LTF breaks up → be cautious.
- ▲ Let the higher timeframe “vote last.”

On Breakouts (out of a range) I firstly need to understand and avoid Fake-Outs (1/2).

Bullish Example

*I understand HTF Direction.
On my bullish example, price may manipulate impatient sellers with a Fake-Out concept and then move bullish based on my bias.*

Now I also have a bullish Breakout setup to take my trade from. In some cases, I can impulsively enter the first candle that closed back inside the range as marked above, after the Fake-Out.

On Breakouts (out of a range) I firstly need to understand and avoid Fake-Outs (2/2).

Bearish Example

I understand HTF Direction. On my bearish example, price may manipulate impatient buyers with a Fake-Out concept and then move bearish based on my bias.

Now I also have a bearish Breakout setup to take my trade from. In some cases, I can impulsively enter the first candle that closed back inside the range as marked above, after the Fake-Out.

Notice the clean correlation between 4H and 15/30mins timeframes.

Fake-Out Entries — *How to Trade Them Correctly*

- ▲ **A Fake-Out is not an automatic trade:** A fake-out only becomes tradable when it aligns with the Higher Timeframe bias and targets. HTF direction always comes first.
- ▲ **The first entry after a Fake-Out is the most aggressive:** This entry appears immediately after price closes into the range towards the direction of HTF. It offers better R:R, but comes with higher risk and requires precision.
- ▲ **The Breakout is the most confirmed & safest entry:** A clean break and close outside the range provides confirmation. This entry is slower but more reliable.
- ▲ **High-Volume times are critical for Fake-Out trades:** Fake-outs are far more effective during session opens and high-liquidity periods. Volume + HTF/LTF correlation = extra confluence.
- ▲ **Advanced execution / Scale intelligently:** A skilled trader may: Take one small-risk position on the Fake-Out & Add a second position on the confirmed Breakout.
- ▲ **Price may continue ranging — and that's OK:** A fake-out does not guarantee a trade. Price can remain inside the range for hour, until our next Sessions or the entire day. No Playbook setup = no trade.

B. Onion

Understanding the Onion Setup

Looking for these setups on the most usual High-Volume Times for reference in GR Time (not full session timings):

- ▲ London: 10:00
 - ▲ Pre-NY: 13:30
 - ▲ NY: 15:00 – 17:00
 - ▲ Asia: 4:00 – 5:00
-
- ▲ I arrive at the desk and price is trending bullish on the 15/30mins.
 - ▲ Price is also a bit overextended and away from the previous support formed.
 - ▲ I do NOT want to take a new buy “up there”, when price has already moved that far from the Support.

“Onion setups can be described like “Break and Retest”

4H Closed Bullish – Directional Bias

- ▲ I expect the new 4H candle to create a new bottom wick, a pullback, on lower timeframes and then flip back up to bullish (it also works on ongoing 4H candles, not only on closures and openings of new 4H candles).
- ▲ Not necessarily need to be the closure of previous 4H and opening of the new one.
- ▲ Now I want to see the formation of a new strong support with a healthy candle.
- ▲ Then during High-Volume times, having also the HTF directional Bias on my side, I need to wait for a bottom wick to get formed and then to execute on my buys from current / previous candle's highs, depending on the situation.
- ▲ Take my profits when price on the 4H, the HTF, fills the wick of the previous 4H candle and fills the range on the LTF (15/30mins).
- ▲ All of the above, want to see them happening during High-Volume times on my Sessions.

The A, B, C points, are how Top wick, Body and Bottom wick respectively of the 4H candle, depict on the lower timeframe.

Onion – Bullish Example

4H Closed Bearish – Directional Bias

- ▲ I expect the new 4H candle to create a new top wick, a pullback, on lower timeframes and then flip back up to bearish (it also works on ongoing 4H candles, not only on closures and openings of new 4H candles).
- ▲ Not necessarily need to be the closure of previous 4H and opening of the new one.
- ▲ Now I want to see the formation of a new strong Resistance with a healthy candle.
- ▲ Then during High-Volume times, having also the HTF directional Bias on my side, I need to wait for a top wick to get formed and then to execute on my sells from current / previous candle's lows, depending on the situation.
- ▲ Take my profits when price on the 4H, the HTF, fills the wick of the previous 4H candle and fills the range on the LTF (15/30mins).
- ▲ All of the above, want to see them happening during High-Volume times on my Sessions.

The A, B, C points, are how Top wick, Body and Bottom wick respectively of the 4H candle, depict on the lower timeframe.

Onion – Bearish Example

C. Celery Play

Understanding the Celery Play

Very similar to the Breakout concept. Comes naturally out of a Ranging market and has a higher probability of playing out.

- ▲ I do have a candle closing out/above the range and I set a Buy Stop for a normal Breakout trade.
- ▲ But Price fluctuates, never taps my order in or nearly taps me and fluctuates near the range.
- ▲ If it has NOT tapped me in, and I am getting close to the last minutes of a candle closure (last 3 minutes of a 15/30mins candle), then I delete my order.
- ▲ If that candle closes inside the range again, then I do not have a trade (or I am reducing my risk if I have the trade open and price had barely tapped me in previously).
- ▲ If that confirmation candle though, closes (bullish example) above the range, I will re-add my Buy Stop order. This is called a Celery play, and, in most cases, it is going to come by default, “will fall into my lap naturally” by price action.
- ▲ It is basically a position where I was going to take a Breakout, but it took a little too long to unravel, unfold, and I settled for a Celery Play.

Tips:

A. It's all about where the candle closes, above or below/inside the range.

B. I don't care if the candle closes to Bullish or Bearish (no matter what my HTF Bias is).

1. Most Common Celery Play – Bullish Example

During High-Volume times, wait for a bottom wick and get an impulsive Buy Trade (from the Celery Candle's High).

2. Less Common Celery Play – Bullish Example

Probably occurring at no High-Volume times or if price is too overextended.

I want to wait for a new support to form and take my buys from it. Safer.

Important Celery Tips

Extra nuances of the “Healthy” Celery Confirmation Candle – (Bullish Scenario)

- ▲ A Big Bottom Wick
- ▲ A Small Top Wick
- ▲ Small Body

Healthy vs Non-Healthy Celery Play Examples #1

Price already moved a lot above the range and the candle closed without a wick

Candle closed as a "Doji" showing indecision and low-volume

Healthy vs Non-Healthy Celery Play Examples #2

Price already moved a lot below the range and the candle closed without a wick

Candle closed as a "Doji" showing indecision and low-volume

Managing a Celery Position

If price has already tapped me IN a trade as a Breakout Setup, I wait for a candle closure:

- ▲ If the Celery Play candle closes outside the range, healthy, I leave my position open.
- ▲ If it closes with a Non-Healthy candle, but above the range I reduce my risk in half and I can keep the position open, knowing it is a riskier trade
- ▲ If it closes back inside the range, I close the position to manage my risk with a small loss.

Celery Play – Bearish Example 1

Celery Play – Bearish Example 2

The “Target Tapped” Concept

- ▶ Everything starts with **High Timeframe (HTF) directional bias**, especially the 4H candle.
- ▶ A **target** is a key HTF objective (clean range, wick fill, supply/demand key level) that **price is moving towards**.
- ▶ When price **reaches and taps a major 4H target**, the original directional move is often **mature or exhausted**.
- ▶ At this point, **continuation is no longer guaranteed**, and market **behavior often changes**.
- ▶ This is where traders shift from “following” price to **observing how price reacts at the target**.
- ▶ Traders can start looking for **Counter Trend** moves at this point.

What Changes After a Target Is Tapped

- ▲ After a 4H target is tapped, I anticipate specific playbook setups to appear, most often: **Fade, Inverted Celery, or Counter-Trend trades**.
- ▲ These trades are typically **shorter-term**, **require faster management**, and are based on **price reaction**, not bias alone.
- ▲ If price slows down, consolidates, or forms a range after the tap, it creates an **observation zone**.
- ▲ From that zone, I can then wait for **high-volume times** to look for **clean playbook entries** again.
- ▲ The key is **patience**: not every target tap is a trade, but every target tap is important information.

“A tapped target doesn’t mean reverse immediately — it means shift from expectation to observation.”

Target Tapped: What Positions to Expect

Impulse

- ▲ The Fade
- ▲ Inverted Celery

Confirmed – “Range 2”

- ▲ Breakout
- ▲ Celery Play
- ▲ Counter Trend Trade

Understanding the “Reactions”

Impulse

An impulse trade happens immediately after the target is tapped, with a fast rejection and strong move in the opposite direction, offering quick entries that require faster execution and tighter management (The Fade / Inverted Celery).

Range 2 - Confirmed

After price taps a 4H target, it may pause, slow down, and form a small consolidation range, this “**observation zone**” allows price to reset before breaking out and offering structured playbook setups such as a Breakout, Celery, or Counter-Trend trade.

The Target Tapped Concept & the Observation Zone

I am NOT trying to call the bottom.

I am looking for signs. In most cases, a new range is going to form after the "target" tapped, an "Observation Zone"

- I do NOT want to take sells down there
- The move already happened
- I am looking for signs to get the move back up

The actual “Observation Zone”

A. If the 4H candle “Tapped the target”, can potentially move back up, to leave a “bottom wick” for the NEXT candle to potentially fall back down.

B. If HTF has already tapped its target, I do not want to enter on a trade to this direction as a counter trend may arise.

Trades to Anticipate after Target is Tapped – *Example #1*

The Fade

Timing is very crucial on 4H candles, need to be aware of how much time is left on a 4H candle and when is the next one opening.

Trades to Anticipate after Target is Tapped – *Example # 2*

Breakout

Timing is very crucial on 4H candles, need to be aware of how much time is left on a 4H candle and when is the next one opening.

D. The Counter Trend Trade

D. The Counter Trend Trade

The Counter Trend Trade Pattern – *Bearish Price*

The 4H candles tapped their target or getting close to tapping them. I want to identify the following pattern on the 15/30mins in order to consider a counter trend trade.

Bearish, overextended price action, going to a 4H target and suddenly a “green-bullish” candle shows up.

- ▲ I don't want to jump into trades immediately, especially if HTF target is not tapped.
- ▲ I wait for some more structure to play out and then make decisions.
- ▲ On heavy bearish markets, price will bait the buyers out who are trying to call the bottom early and then will keep moving bearish (and even break through HTF previous targets) at **# 1**. So, this is why I need to wait for some structure, especially on these trading days.
- ▲ On **# 2**, we broke the highs, manipulated more buyers out of the market, turned bearish and a new range formed.
- ▲ Then on the next candle, price usually will impulsively move down tap the HTF targets, manipulates sellers in, at this point as well, and then impulsively turn bullish and close above the newly formed range (Pack Runner **# 3**).

Identify LQ manipulations on Buyers and Sellers on this concept along with HTF/LTF correlation and High-Volume times are the keys.

Keep an eye on the 4H, Break of Highs as they are very strong confirmations.

Wait for a bottom wick and take the counter trend trade.

The Counter Trend Trade Pattern– Bearish Example

This is a very specific pattern that usually occurs at a 4H Target.

Price creates a consolidation – “Observation Zone”, manipulates everyone out and then gives the pullback move.

The Counter Trend Trade Pattern – *Bullish Price*

The 4H candles tapped their target or getting close to tapping them. I want to identify the following pattern on the 15/30mins in order to consider a counter trend trade.

Bullish, overextended price action, going to a 4H target and suddenly a “red-bearish” candle shows up.

- ▲ I don't want to jump into trades immediately, especially if HTF target is not tapped.
- ▲ I wait for some more structure to play out and then make decisions.
- ▲ On heavy bullish markets, price will bait the sellers out who are trying to call the top early and then will keep moving bullish (and even break through HTF Previous targets) at **# 1**. So, this is why I need to wait for some structure, specially on these trading days.
- ▲ On **# 2**, we broke the lows, manipulated more sellers out of the market, turned bullish and a new range formed.
- ▲ Then on the next candle, price usually will impulsively move up tap the HTF targets, manipulates buyers in, at this point as well, and then impulsively turn bearish and close below the newly formed range (Pack Runner **# 3**).

Identify LQ manipulations on Buyers and Sellers on this concept along with HTF/LTF correlation and High-Volume times are the keys.

Keep an eye on the 4H, Break of Lows as they are very strong confirmations.

Wait for a top wick and take the counter trend trade.

The Counter Trend Trade Pattern – Bullish Example

This is a very specific pattern that usually occurs at a 4H Target.

Price creates a consolidation – “Observation Zone”, manipulates everyone out and then gives the pullback move.

Impulse Trades

Impulse Trades & Entries

A trade taken into times of high volume, without a “confirmation candle”, e.g. Bullish price action- uptrend.

- ▲ Assuming I am waiting for support to be formed. Entering on a time of High – Volume
- ▲ In many situations during times of High-Volume, I will NOT get a nice candle printed to enter the trade of it, and that candle is the one which is going to “drive” immediately.

Impulse trades exist with the Trend as well as Counter Trend.

- ▲ **With the Trend:** Onion / Inverted Celery / Fake-Out when looking for a breakout with the trend or even The Fade.
- ▲ **Counter Trend:** The Fade or Inverted Celery, especially when “Target Tapped” concept.

E. Inverted Celery

The Inverted Celery - Types

The Inverted Celery is an impulsive entry model, taken only during High Volume times, that allows participation in strong moves without waiting for a confirmation candle.

A. Inverted Celery — With the Trend

- I am normally looking for an Onion setup with the trend that requires a pullback and a clear support/resistance to form before the entry.
- During high-volume times, price often moves too fast and does not create that structure.
- When HTF direction is clear and HTF/LTF are aligned, the Inverted Celery allows entering impulsively to avoid missing the move.
- This setup relies on bias, timing, and volume, not waiting for a candle confirmation.

B. Inverted Celery — Counter Trend

- After a 4H target is tapped, price may reject strongly from that level.
- This rejection often prints a strong rejection / exhaustion wick from the tapped zone, a small body and a small wick on the other side of the candle and closes back, below or above the target tapped.
- This signals exhaustion, allowing an impulsive counter-trend entry on the next candle.
- These trades are managed quickly in terms of Take Profit, Break Even and Stop Loss levels, as they are Counter Trend moves.

A. Inverted Celery – *With the Trend Bullish Example*

I am looking for an Onion setup with the trend.

But according to the Onion Setup, in order to have proper confirmation, I want a bullish candle closure after the pullback, to form a strong support for the bullish example, and take my buys.

But many times, during High-Volume times, prices will move impulsively and will not give me that bullish candle to form a support. So, I want to take advantage of the High-Volume time and my understanding on the Directional Bias and the HTF/LTF correlation.

- ▲ I like a steep bottom wick and even better if it breaks previous low for LQ, to act like a “Pack-Runner”, having manipulated sellers out / “sellers activated”.
- ▲ On High-Volume times, support is not going to get formed. Volume will push prices up impulsively. Just need a small bottom wick (bullish example).

The “Anatomy of the candles is Key here as well. Weak Top Wick, Weak body, Steep / Strong Bottom wick – Bullish Example.

“Applied Knowledge is Power”

A. Inverted Celery with the Trend – Bullish Example

Bullish Example.

The “Anatomy of the candles is Key here as well.

- *Steep / Strong Bottom wick*
- *Weak Top Wick*
- *Weak body (no matter if bullish or bearish)*

A. Inverted Celery – *With the Trend Bearish Example*

I am looking for an Onion setup with the trend.

But according to the Onion Setup, in order to have proper confirmation, I want a bearish candle closure after the pullback, to form a strong Resistance for the bearish example, and take my sells.

But many times, during High-Volume times, prices will move impulsively and will not give me that bearish candle to form a resistance. So, I want to take advantage of the High-Volume time and my understanding on the Directional Bias and the HTF/LTF correlation.

- ▲ I like a steep top wick and even better if it breaks previous highs for LQ, to act like a “Pack-Runner”, having manipulated buyers out / “buyers activated”.
- ▲ On High-Volume times, resistance is not going to get formed. Volume will push prices down impulsively. Just need a small top wick (bearish example).

The “Anatomy of the candles is Key here as well. Weak Bottom Wick, Weak body, Steep / Strong Top wick – Bullish Example.

“Applied Knowledge is Power”

A. Inverted Celery with the Trend – Bearish Example

Bearish Example.

The “Anatomy of the candles is Key here as well.

- *Steep / Strong Top wick*
- *Weak Bottom Wick*
- *Weak body (no matter if bullish or bearish)*

B. Inverted Celery Counter Trend

Price moving heavily bullish on that day.

Taps a strong 4H target and on the next candle We spot a nice rejection candle forming during High Volume times (1).

There are 2 entry options:

- A. *Entry at the break of current candle Lows if there is still time on that 15mins candle (e.g. more than 5mins until it closes)*
- B. *If it closes like that, We can wait for next candle to make a top wick and then enter on the break of previous candle's Low.*

**Bullish
Example**

B. Inverted Celery Counter Trend– Bullish Example

*Current Candle
Entry Example*

B. Inverted Celery Counter Trend

Price moving heavily bearish on that day.

Taps a strong 4H target and on the next candle We spot a nice rejection candle forming during High Volume times (1).

There are 2 entry options:

- A. *Entry at the break of current candle Highs if there is still time on that 15mins candle (e.g. more than 5mins until it closes)*
- B. *If it closes like that, We can wait for next candle to make a bottom wick and then enter on the break of previous candle's Highs.*

Bearish Example

F. The Fade

The Fade – *Going against the Bias*

A lot of the confluences start at 4H, 4H plays a massive role on this setup formation.

We utilize the 15mins timeframe to understand if the 4H candle is “done” moving up or it can start rejecting – Fade Approaching.

Although it doesn't mean that the 4H target tapped will make the price reject and move lower, it could very likely keep driving up.

e.g. At an overall Bullish day, I arrive at the desk and notice that the 4H candle has already filled the range, created a support and tapped the target creating a resistance.

- ✓ *Need High Volume Time*
- ✓ *No confirmation candle is required on The Fade Setup – its impulsive*
- ✓ *Need to manage the trade quickly - Take Profit, Partial, Break Even.*

Confluences that a Fade maybe approaching (bullish):

- ▲ 4H Candles has already moved “a lot” - overextended
- ▲ 4H Candle has tapped a recent resistance level notice if previous times that price reached that resistance level, if it has rejected again or not.
- ▲ Go on the 15mins and locate the candle and how it reacted to that 4H resistance zone.
- ▲ Then check the next 15mins candle are the lower wicks of the candle smaller?
- ▲ Did it fail to fill the previous 15min candle wick-top wick? Did it close below the range?
- ▲ If any other 15mins candle – check if the Highs are not breaking, and are respecting each other, plus are the candles getting weaker?
- ▲ The Bullish momentum is slowing down.
- ▲ Expecting the 4H candle to leave a rejection wick, to be filled later on.

The Fade – Bullish Counter trend Example

*I do NOT need
Confirmation
Candle here.*

The Fade – *Bullish Example*

It all starts with the HTF Directional Bias and the 4H candles.

Let's assume that the 4H candles on a bullish example reached their 4H destination – Target Tapped Concept and now I am looking for a quick counter trend sell trade on the 15/30mins timeframe.

- ▲ I want to catch up with the counter trend / quick move. Notice the bottom wicks of the candles getting smaller – volume weakens for buyers.
- ▲ The top wicks show strong rejections on the target tapped – like exhaustion wicks.
- ▲ Price is for sure bullish and overextended.
- ▲ High-Volume time setup to take only. The Fades are impulsive trades, **without confirmation candles to wait for**.
- ▲ I need quick trade management, BE & Partials.
- ▲ If I have a “Pack-Runner” LQ grab at the top, it acts like extra confluence, nice confluence for me to take the trade (indicated the manipulation of the last buyers).

- ✓ *4H strong Target Tapped*
- ✓ *Top Wicks start forming a Bearish “trend”*
- ✓ *No confirmation candle on The Fade Setup – its impulsive*
- ✓ *Signs of rejection, volume reduces and Big top wicks showing rejection*
- ✓ *Pack Runner – LQ Grabs on the highs is bonus confluence*

The Fade – *Bearish Example*

It all starts with the HTF Directional Bias and the 4H candles.

Let's assume that the 4H candles on a bearish example reached their 4H destination – Target Tapped Concept and now I am looking for a quick counter trend buy trade on the 15/30mins timeframe.

- ▲ I want to catch up with the counter trend / quick move. Notice the top wicks of the candles getting smaller – volume weakens for sellers.
- ▲ The bottom wicks show strong rejections on the target tapped – like exhaustion wicks.
- ▲ Price is for sure bearish and overextended.
- ▲ High-Volume time setup to take only. The Fades are impulsive trades, **without confirmation candles to wait for**.
- ▲ I need quick trade management, BE & Partials.
- ▲ If I have a “Pack-Runner” LQ grab at the bottom, it acts like extra confluence, nice confluence for me to take the trade (indicated the manipulation of the last sellers).

- ✓ *4H strong Target Tapped*
- ✓ *Top Wicks start forming a Bullish “trend”*
- ✓ *No confirmation candle on The Fade Setup – its impulsive*
- ✓ *Signs of rejection, volume reduces and Big bottom wicks showing rejection*
- ✓ *Pack Runner – LQ Grabs on the lows is bonus confluence*

The Fade – Bearish Counter trend Example

*I do NOT need
Confirmation
Candle here.*

The Fade – *Going with the Bias (Prop-trend)*

4H Candles points us in the correct direction for our session bias.

e.g. I see the 4H trend to be bullish overall and a 4H support has formed. So, on the next 4H candle, I anticipate a lower wick to then continue driving up, to fill the range / wick and tap a target.

- ▲ The Fade is meant to be “Taken” only during High-Volume times. In fact, all impulse trades do so.
- ▲ On a Bullish / Trending Market, we are going to be looking for a Support to be formed.

- ✓ *During times of High-Volume, our “Confirmation” candle, may not “print” that nicely, but we do NOT want to lose the move.*
- ✓ *The 4H Movement and Targets is the most important aspect of understanding a Fade.*

The Fade with the Trend – Bearish Example

During times of High-Volume, our “Confirmation” candle, may not “print” that nicely, but we do NOT want to lose the move.

The 4H Movement and Targets is the most important aspect of understanding a Fade.

The Fade may come as...

Scenario 1:

If a nice rejection wick forms with a small top wick on bullish scenarios, I am expecting a "Fade".

The Fade is going to form as an Inverted Celery, entry on the break of the High (A).

Inverted Celery

Impulse trade on the next candle

Scenario 2:

If the next candle respects the highs and the lows of the previous candle, I can impulsively enter on the break of current candle Highs (B).

Stop Loss Placement

Stop Loss Placement

“Any time I can use previous candle SL, I do it for extra safety.”

Anytime I enter on the previous candle (break of lows, highs) I can use the current candles highs, lows as a SL

Anytime I enter on the current candle (break of highs, lows), I can use the previous candle's highs, lows as a SL

Sometimes I can place my SL inside a range as well for extra protection or above, below the wicks (if there are many wicks gathered at a rejection are to the left, at the levels of the price level I want to trade in).

Trading under Specific Market Conditions

Trading the Trend

Trading the Trend

- ▲ I am looking for “healthy” candles on the “High-Timeframe” (4H Charts).
- ▲ If the 4H candle is “pushing” (e.g. – Bullish) at a heavy – nice way, then most likely I will have nice trending movement and clean traffic on lower timeframes (Higher Highs – Higher Lows).
- ▲ If I come to the desk and (e.g.) the Daily-4H and 1H timeframes are very bullish, I do want to wait for some kind of a pullback first, the creation of a nice Support to form, to then take buys from it (Resistance for Sells on Bearish trend).
- ▲ Could typically look for price to “tap” a previous range – Resistance, then give me a pullback and then create that Support to take my buys from (a new higher low – example below).
- ▲ When price is trending, I am looking for the creation of a new Higher Low and the formation of a Support. I do NOT have to necessarily look for a “Breakout” from a range on this situation (cause it may never form and I lose the move).

- *I do NOT need to look for a Breakout on a Trending Market.*
- *I am looking for a pullback and support to be formed OR for an Inverted Celery Position.*
- *I want to take advantage of my knowledge on Trend Direction.*

Trading the Trend – Bearish Example

- *I do NOT need to look for a Breakout on a Trending Market.*
- *I am looking for a pullback and support to be formed OR for an Inverted Celery Position.*
- *I want to take advantage of my knowledge on Trend Direction.*

Counter Trend Trading

Counter Trend Trading - *(Care for Fake Rejections)*

- ▲ Let's assume that the HTF (4H) is Bullish and it "runs" into an area of Strong Resistance, identified from the left side of the chart – a range probably.
- ▲ If a range is formed and price slows down in that area, in case I am considering a counter trend – sell move, I need to be extra cautious, in order to avoid a "Fake-Out" and price probably will keep moving bullish (for this example).

- *Care for the Fake Rejection move, NOT ready to Counter-Trend yet.*

Counter Trend Trading – Bearish Example

*Care for the Fake
Rejection move,
NOT ready to
Counter-Trend yet.*

How I can take advantage of Rejection Zones - (4H Timeframe)

Option 1:

- ▲ If a quick rejection is clearly identified, and I am on the charts, I could take a Fade, or Inverted Celery Impulse position.

As an Option 2:

- ▲ After the range is formed, I wait for a break and retest. It is key to remain below the range in this example.
- ▲ This is when the 4H candle probably starts to re-break its own low (incl. clean range / traffic to the left).

Counter Trend Trading – Bullish Example

Price Slows Down, taps the 4H target and starts forming a new Range.

Due to the Counter trend Trades riskier nature, I do NOT want to instantly get on a Buy trade.

Instead, I want to wait for a more confirmed "Range 2" price action confirmation to trade from.

Inverted Celery Counter Trend– Impulse Example

*Current Candle
Entry Example*

Option 1

The Fade – Bearish Counter trend Example

*I do NOT need
Confirmation
Candle here.*

Option 1

Trading a Ranging Market

Trading a Ranging Market

Ranges are mainly created to give more info on low-volume times, gather liquidity (fuel for the market), manipulate impatient traders out and then lead to a big move on High-Volume Times.

- ▲ 4H Price fluctuates, it tries to make a decision.
- ▲ Not enough Volume and not in a training market = Range / Consolidation.
- ▲ I can now “trap” price and look for Breakouts. Always keep in mind the HTF Bias.

TBC...
